

# DIGITAL MAPPING TECHNIQUES 2015

The following was presented at DMT'15  
(May 17-20, 2015 - Utah Geological Survey,  
Salt Lake City, UT)

The contents of this document are provisional

### **INTRODUCTION**

Two recently prepared geologic map databases, one newly published and one in review, follow the NCGMP09 (NCGMP09, 2010) specification for the organization of digital geologic map data. Posters describing the general schema and workflow for the creation of the databases were presented at the 2015 Digital Mapping Techniques Workshop (DMT) in Salt Lake City, Utah and are available online at <http://foobar> as Adobe PDF files.

BaranofSchema.pdf shows the workflow and schema of the digital geologic map database that accompanies Scientific Investigations Map 3335, Geologic map of Baranof Island, southeastern Alaska (Karl et al., 2015). The database was transcribed from ArcINFO coverages by Evan Thoms from the Alaska Science Center and edited thereafter as an ArcGIS file geodatabase.

The schema and workflow for an NCGMP09-compliant database to accompany Scientific Investigations Map 2832, Geologic map of Mount Mazama and Crater Lake, Oregon (Bacon, 2008) is shown in CraterLakeSchema.pdf. The translation of the original geologic map data from ArcINFO coverages to an ArcGIS file geodatabase in the NCGMP09 schema was done by Heather Bleick while an employee with the Volcano Science Center.

### **TOWARD A VISUAL README FORMAT**

In preparing these posters, I realized I was exploring the expediency of creating “visual readmes” for the increasingly complex geologic map datasets the USGS is producing. I would argue that the current formats of text-based metadata and readme files for geologic map databases do not lend themselves to quickly understanding the breadth, depth, and schema details of the data, especially for users who may lack the skills or software to investigate the data within a GIS. A single illustrated document might be easier to interpret than a readme file, cross-referenced against the NCGMP09 documentation, and the metadata. Not to mention that text-only formats are inadequate for poster presentations.

The layout of a visual readme document might contain the following items:

- An index map, or a set of index maps at successively larger scales, to show the geographic extent of the data.
- Separate map frames showing the features of just one feature class with a linked list of field names.
- Relationship lines or color-coded links between fields and other tables to which they might share relationships, including domain values.
- The list of topology rules.
- Definitions of tables, fields, domain values, and Glossary terms.
- A clear explanation of how features are symbolized and the names of style or layer files.
- The principle process steps followed during the creation of the database.

Consider an exploded diagram of a geodatabase with relationship lines (or some other symbolization) between graphical or text-based representations of the different parts. It has the potential to eliminate much page-turning through the NCGMP09 standard, file browsing, and metadata deciphering. All of the relevant information can be encoded in objects within a geodatabase (domains, relationship classes, DataSources table, a ProcessStep table, etc.) and could be called, along with the GIS-calculated metadata (spatial reference, geographic extent, feature counts, geometry details, etc.) in a script that would build the document.

An existing, but soon to be obsolete utility (see this GeoNet discussion thread: <https://geonet.esri.com/thread/118432>), which automates the production of some of these items is ArcGIS Diagrammer (Version 10.0.1, ESRI, 2008). It was designed for database designers to edit or analyze ArcGIS database schemas in Visual Studio and is thus more complicated than necessary to create a simple visual readme. Still, it is the program I used to create the table graphics seen in the posters and it offers HTML views of separated feature class maps, enumerated domain values, and field metadata, among other information. For the time being, this software is probably the best starting point for creating visual readme layouts.

A visual readme could be included with the publication or generated in a poster format for presentation. The posters I created for DMT do not represent the ideal product, but I am intrigued by the result and the possibility for future work.

**About this work:**  
 The Volcano Science Center of the USGS has begun applying the NCGMP09 standard for geologic map databases to both new and legacy publications. Heather Bleick completed the transcription shown here of legacy GIS data in 2014 but died with the publication still in review. Believing that her efforts deserve attention as another example of applying the NCGMP09 standard, I have produced this poster but take no credit for the authorship of the database. - Evan Thoms

**Workflow** (from the metadata)  
 This ArcGIS geodatabase is a transcription of the ArcInfo coverages (Ramsey and others, 2008) that were constructed in order to produce a geologic map (Bacon, 2008) as a basis for understanding processes and volcano hazards involved in the eruptions of Crater Lake Volcano.

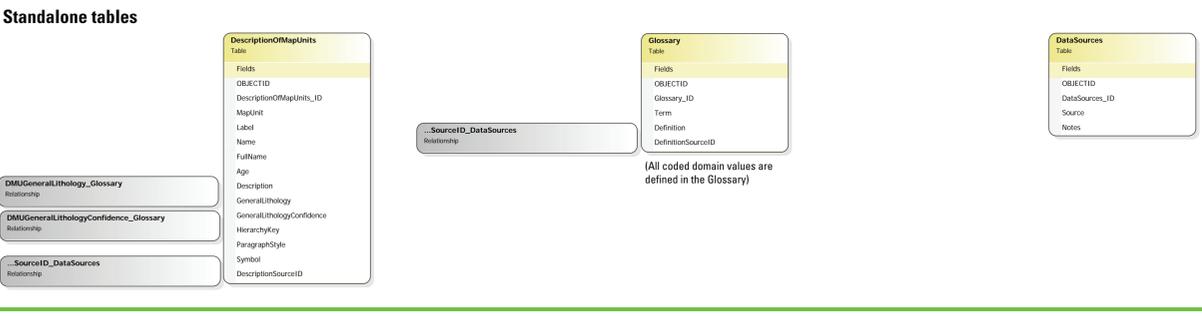

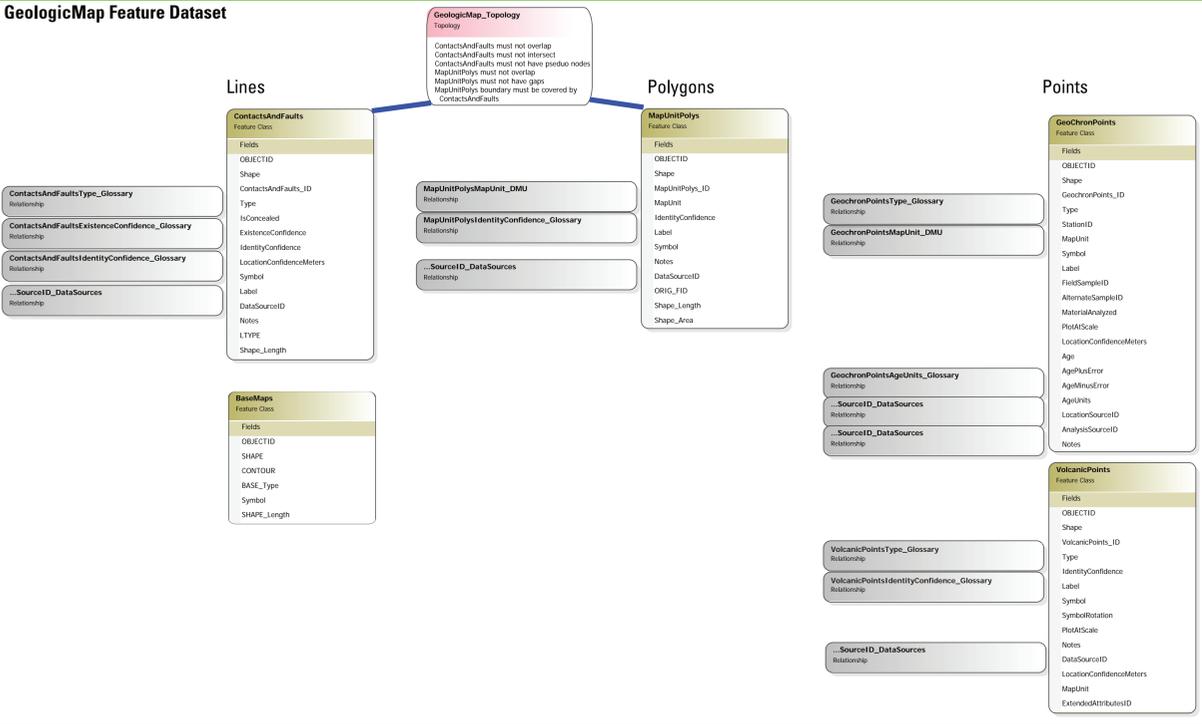

Changes from the ArcInfo coverages to ArcGIS geodatabase include:  
 1) Converted the previously published quad-by-quad coverages in ArcInfo 7.2 to the more modern and widely used geodatabase in ArcGIS 10.2. In order to do this coverages were merged and imported into a geodatabase.  
 2) Then quadrangle boundaries were eliminated and contact lines were snapped to recreate new polygons. This will allow users to use seamless data across quadrangle boundaries.  
 3) Additionally, feature classes in the geodatabase were updated with the fields and layout by the NCGMP09 schema. Tables including DataSources, DescriptionOfMapUnits, and Glossary were created again following the NCGMP09 schema.  
 4) Lastly, metadata using the FGDC format was created reflecting updates and changes to the data. The FGDC metadata is embedded in the geodatabase and all accompanying files.

**DESCRIPTION OF MAP UNITS**

(Labels ending in the letter 'y' indicate pyroclastic flows, ending in the letter 'l' indicate lava flows.)

**1. Tuff (Hoboken and Pinkstone):** Unconsolidated late and thick colluvium (especially in northeast corner of map). Roughly like surface, includes post-1700 B.P. talus, scree, sand, and probable fine-flow and minor basaltic material. Generally covers a base 10' thick.

**2. Landslide (Hoboken):** Landslide and debris-avalanche deposits, mostly beneath the surface of Crater Lake (Hoboken and others, 2002). Composed of unconsolidated, poorly sorted, typically highly indurated debris derived from the colluvium and transported into the lake by river washing. Debris-avalanche deposits have brecciated surfaces and contain little blocks in large areas. One of the debris-avalanche deposits that covers a large area of the north side of the lake is associated with the extensive range of pyroclastic flows that includes Lagoon, Alamo, and other deposits, below Chalky Bay, has a volume of 0.2-0.3 km<sup>3</sup> and reached 2-3 km from its source.

**3. Charlat deposits, undivided (Pinkstone):** Till and minor associated outwash forming a discontinuous mantle on the slopes of Mount Mazama, basal breccias, extensive debris cone of 100-1200' W, and loam exposed locally in the crater walls. Till unconformably on basaltic andesite. Several meters of debris, abundant or scattered volcanic clasts, and presence of stratified material in several places. No attempt was made to divide into deposits of different ages. Till overlies by Hoboken pumice-fall deposits west of Chatterbox Cone, near Pinkadee Point, and at Skull Head, as well as west off on the slopes of Mount Mazama and off the forested forest land.

**4. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**5. Sediment gravelly-flow deposits (Hoboken):** Clastic sediment in the three major basins and in depressions on and between lava flows and landslide deposits on the floor of Crater Lake (Hoboken and others, 1980; Bacon and others, 2002). Maximum thickness 75 m in the east basin and 30 m in the west and northwest basins (Hoboken and others, 1980). Uppermost layers consist of sand.

**6. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**7. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**8. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**9. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**10. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**11. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**12. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**13. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**14. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**15. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**16. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**17. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**18. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**19. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**20. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**21. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**22. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**23. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**24. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**25. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**26. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**27. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**28. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**29. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**30. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**31. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**32. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**33. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**34. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**35. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**36. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**37. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**38. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**39. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**40. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**41. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**42. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**43. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**44. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**45. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**46. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**47. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**48. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**49. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**50. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**51. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**52. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**53. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**54. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**55. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**56. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**57. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**58. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**59. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**60. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**61. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**62. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**63. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**64. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**65. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**66. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**67. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**68. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**69. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**70. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**71. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**72. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**73. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**74. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**75. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**76. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**77. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**78. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**79. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**80. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**81. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**82. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**83. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**84. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**85. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**86. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**87. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**88. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**89. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**90. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**91. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**92. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**93. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**94. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**95. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**96. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**97. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**98. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

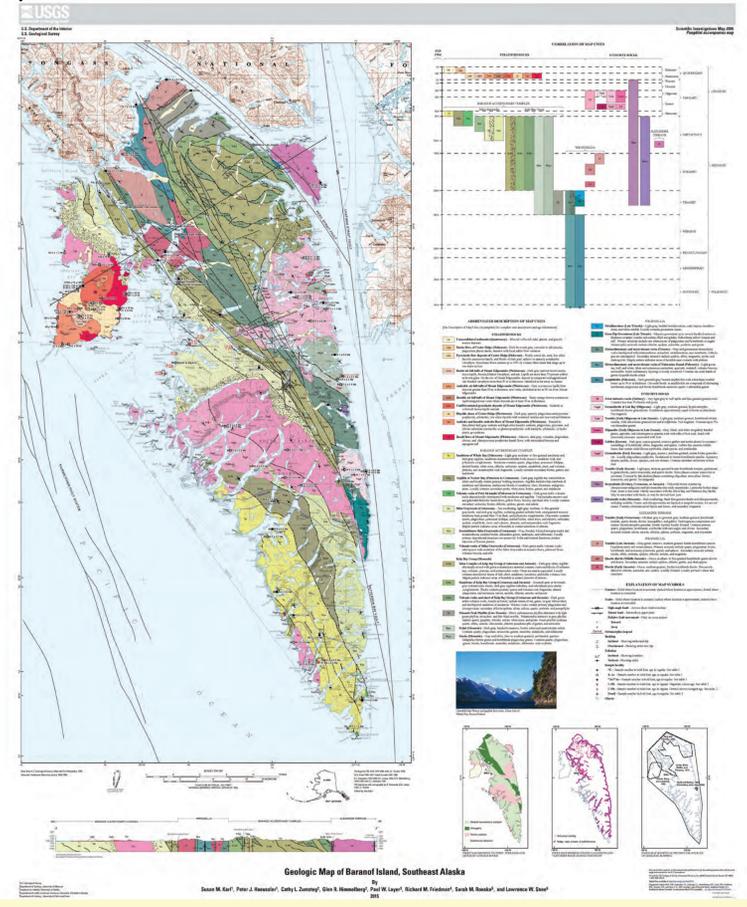

**99. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**100. Lava (Hoboken and Pinkstone):** Unconsolidated water-transported mud, sand, gravel, and coarse debris deposited in or adjacent to present-day streams. Typically contains a large fraction of material overlain from deposits of clastic origin.

**Workflow**

- 1) Converted ArcINFORM coverages to ArcGIS 10.2 file geodatabase, mostly keeping intact the original National Surveys and Analysis (NSA) schema.
- 2) Edited lines and polygons with a lines-and-label-points-method, not through explicit topology class. A geoprocessing script automated the polygon feature class deletion, creation, and layer creation steps required for this method.
- 3) Moved data into NCGMP09 v1.1 schema and attributed the tables based on the Description of Map Units pamphlet, arcodes from the NSA schema, parsing of existing concatenated values, etc. LocationConfidenceMeters for all lines was determined by starting with, roughly, the thickness of a 'fault, certain' line on the map at the published scale (75 m) and doubling for each additional level of uncertainty, e.g. originally tagged 'approximate', 'concealed', or with query marks.
- 4) Scripted the discovery of unique values for all NCGMP09 controlled fields throughout the geodatabase and populated the Term field in the Glossary. Created definitions or copied them in through joins with other dictionary-like tables, e.g. NCGMP09 General Lithology, although there are many instances of 'This study'.
- 5) Edited one metadata template xml file for the geodatabase as a whole. A geoprocessing script then exported FGDC metadata files for all data objects, migrated appropriate metadata elements to each metadata files, and wrote Entity Attribute Domain values for each NCGMP09 controlled field based on entries in the Glossary and DataSources.
- 6) Scripted the creation and assignment of domains based on controlled fields and Glossary entries. Scripted the creation of relationships. Used ArcGIS Diagrammer to create the object and relationship graphics seen here.
- 7) Mostly because of limited time, opted not to convert the cross section from Illustrator to ArcGIS.

**Map sheet (in review)**

Karl, S.M., Haeussler, P.J., Zumsteg, C.L., Himmelberg, G.R., Layer, P.W., Friedman, R.M., Roeske, S.M., and Snee, L.W., 2015, Geologic map of Baranof Island, southeast Alaska: U.S. Geological Survey Scientific Investigations Map 3335, pamphlet 82p., <http://dx.doi.org/10.3133/sim3335>

**Geodatabase objects**

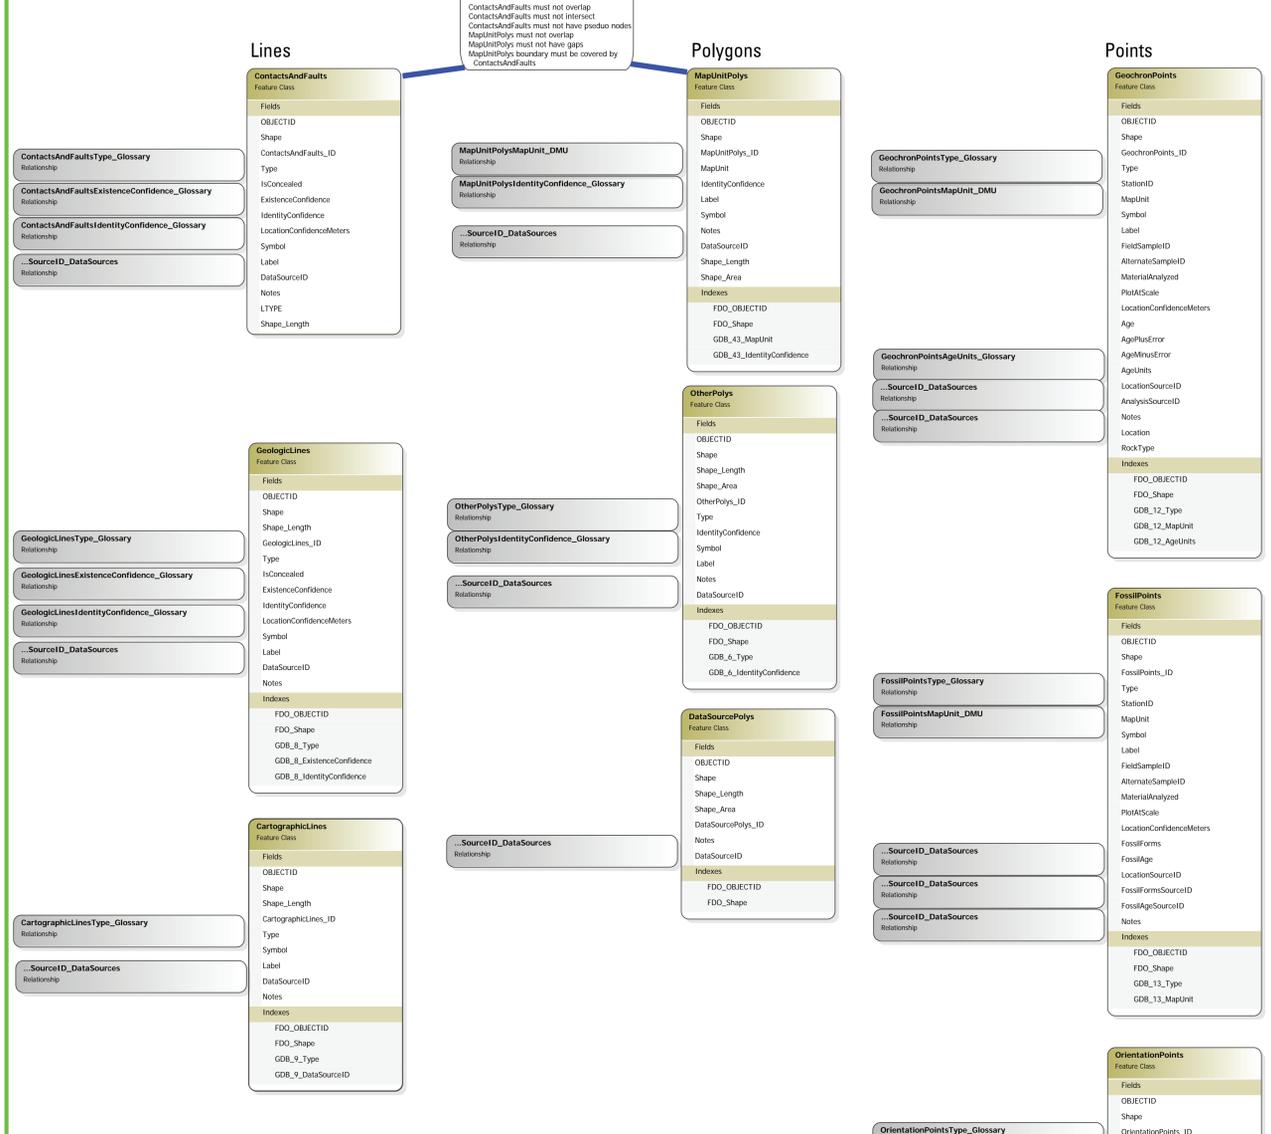

**Tip** - you have HierarchyKey values like 1.2.3.4 and you need 01.02.03.04. Run this python expression in the Field Calculator:

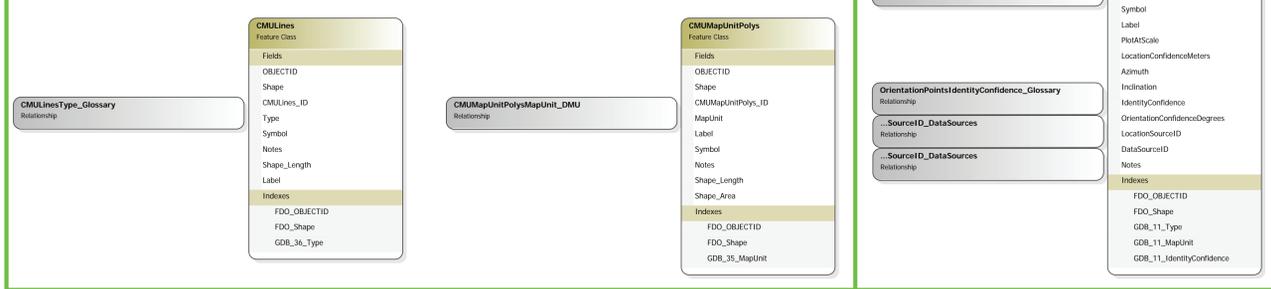

```
Pre-Logic Script Code:
def zfill(hkey):
    l = hkey.split('.')
    return ''.join(['x'.zfill(2) for x in l])

Source =
HierarchyKey =
zfill(!HierarchyKey!)
```

**GeologicMap Feature Dataset**

**CorrelationOfMapUnits Feature Dataset**

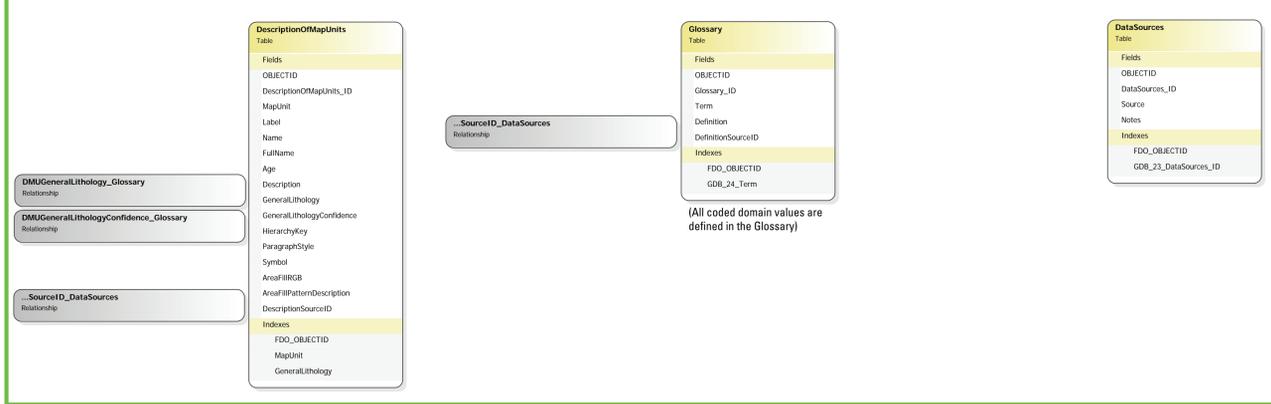

**Domains** - created from values in <table name>\_<field name> and then assigned to the field

<p><b>ContactsAndFaults_Type</b> Coded Value Domain</p> <ul style="list-style-type: none"> <li>right-lateral fault (right-lateral fault)</li> <li>map neoline (map neoline)</li> <li>shoreline (shoreline)</li> <li>generic fault (generic fault)</li> <li>left-lateral fault (left-lateral fault)</li> <li>contact (contact)</li> <li>thrust fault (thrust fault)</li> <li>ice contact (ice contact)</li> <li>normal fault (normal fault)</li> </ul>	<p><b>DescriptionOfMapUnits_MapUnit</b> Coded Value Domain</p> <ul style="list-style-type: none"> <li>Ou (Ou)</li> <li>Oda (Oda)</li> <li>Oaf (Oaf)</li> <li>Oafc (Oafc)</li> <li>Oafa (Oafa)</li> <li>Oafb (Oafb)</li> <li>Oafu (Oafu)</li> <li>Oa (Oa)</li> <li>Ob (Ob)</li> <li>Os (Os)</li> <li>Ts (Ts)</li> <li>Tka (Tka)</li> <li>Tkv (Tkv)</li> <li>Ks (Ks)</li> <li>Kss (Kss)</li> <li>Ksv (Ksv)</li> <li>Kkk (Kkk)</li> <li>Kkv (Kkv)</li> <li>Trp (Trp)</li> <li>Msa (Msa)</li> <li>Magn (Magn)</li> <li>Trm (Trm)</li> <li>Trg (Trg)</li> <li>Trw (Trw)</li> <li>Pzw (Pzw)</li> <li>Pza (Pza)</li> <li>Tir (Tir)</li> <li>Togd (Togd)</li> <li>Toet (Toet)</li> <li>Toetm (Toetm)</li> <li>Tegb (Tegb)</li> <li>Tegd (Tegd)</li> <li>Tet (Tet)</li> <li>Tms (Tms)</li> <li>Mzum (Mzum)</li> <li>Kt (Kt)</li> <li>Jt (Jt)</li> <li>Apd (Apd)</li> <li>As (As)</li> </ul> <p>(This domain is assigned to all MapUnit fields)</p>	<p><b>DescriptionOfMapUnits_GeneralLitho</b> Coded Value Domain</p> <ul style="list-style-type: none"> <li>Clastic sediment (Clastic sediment)</li> <li>Felsic-composition lava flows (Felsic-composition lava flows)</li> <li>Felsic-composition pyroclastic flows (Felsic-composition pyroclastic flows)</li> <li>Intermediate-composition air-fall tephra (Intermediate-composition air-fall tephra)</li> <li>Mafic-composition air-fall tephra (Mafic-composition air-fall tephra)</li> <li>Pyroclastic flows (Pyroclastic flows)</li> <li>Intermediate-composition lava flows (Intermediate-composition lava flows)</li> <li>Mafic-composition lava flows (Mafic-composition lava flows)</li> <li>Mostly sandstone, interbedded with other Sandstone (Sandstone)</li> <li>Metasedimentary rock (Metasedimentary rock)</li> <li>Slate and phyllite, of sedimentary rock or Schist and gneiss, of sedimentary rock or Marble (Marble)</li> <li>Metagneous rock (Metagneous rock)</li> <li>Medium and high-grade regional metams (Medium and high-grade regional metams)</li> <li>Coarse-grained, felsic-composition intrus (Coarse-grained, felsic-composition intrus)</li> <li>Igneous and metamorphic rock (Igneous and metamorphic rock)</li> <li>Coarse-grained, mafic-composition intrus (Coarse-grained, mafic-composition intrus)</li> <li>Fine-grained, intermediate-composition intrus (Fine-grained, intermediate-composition intrus)</li> <li>Deformation-related metamorphic rock (Deformation-related metamorphic rock)</li> <li>Ultramafic intrusive igneous rock (Ultramafic intrusive igneous rock)</li> </ul>	<p><b>Confidence</b> Coded Value Domain</p> <ul style="list-style-type: none"> <li>certain (certain)</li> <li>questionable (questionable)</li> </ul> <p>(This domain is assigned to all ExistenceConfidence and IdentityConfidence fields)</p>	<p><b>GeologicLines_Type</b> Coded Value Domain</p> <ul style="list-style-type: none"> <li>metamorphic facies boundary (metamorphic facies boundary)</li> <li>scratch boundary (scratch boundary)</li> </ul>	<p><b>OrientationPoints_Type</b> Coded Value Domain</p> <ul style="list-style-type: none"> <li>foliation (foliation)</li> <li>upright bedding (upright bedding)</li> <li>overturned bedding (overturned bedding)</li> <li>Inclination (Inclination)</li> </ul>	<p><b>GeochronPoints_AgeUnits</b> Coded Value Domain</p> <ul style="list-style-type: none"> <li>Mu (Mu)</li> <li>ka (ka)</li> <li>yr BP (yr BP)</li> </ul>	<p><b>CMULines_Type</b> Coded Value Domain</p> <ul style="list-style-type: none"> <li>horizontal bracket (horizontal bracket)</li> <li>vertical bracket (vertical bracket)</li> <li>left axis (left axis)</li> <li>age line (age line)</li> </ul>	<p><b>GeochronPoints_Type</b> Coded Value Domain</p> <ul style="list-style-type: none"> <li>A-Ar (A-Ar)</li> <li>K-Ar (K-Ar)</li> <li>U-Pb, m (U-Pb, m)</li> <li>C14 (C14)</li> <li>U-Pb, d (U-Pb, d)</li> </ul>	<p><b>CartographicLines_Type</b> Coded Value Domain</p> <ul style="list-style-type: none"> <li>line of cross section (line of cross section)</li> </ul>	<p><b>DescriptionOfMapUnits_ParagraphStyle</b> Coded Value Domain</p> <ul style="list-style-type: none"> <li>[DMU-Heading] (DMU-Heading1)</li> <li>[DMU Unit 1 (DMU Unit 1)] (DMU-Heading2)</li> <li>[DMU-Heading] (DMU-Heading3)</li> <li>[DMU Unit 1 (1st after heading)] (DMU Unit 1)</li> <li>[DMU Unit 2 (DMU Unit 2)] (DMU-Heading2)</li> <li>[DMU-Heading?] (DMU-Heading2)</li> </ul>	<p><b>OtherPolys_Type</b> Coded Value Domain</p> <ul style="list-style-type: none"> <li>area of hornfels alteration (area of hornfels alteration)</li> </ul>

**Disclaimer**  
Any use of trade, firm, or product names is for descriptive purposes only and does not imply endorsement by the U.S. Government

**Standalone tables**

**Tip** - 'MUP' + OBJECTID gives you a MapUnitPolys\_ID of 'MUP84' but you want 'MUP084'. Use this python expression in the Field Calculator:  
'MUP' + str(!OBJECTID!).zfill(4)

**Tip** - XML metadata resources: scripting - ElementTree python module, manual element inserting or deleting - XML Notepad, manual element text editing and viewing - Notepad++, validating - mp.exe (<http://geology.usgs.gov/tools/metadata/tools/doc/mp.html>) - faster than the ArcGIS geoprocessing tools built on mp.exe

**Acknowledgements**  
Keith Labay and Nora Shew (both USGS) originally digitized into ArcINFORM coverages and attributed the map features according to the National Surveys and Analysis schema.
